of Pedagogical Education named after Qori Niyazi*

Annotation

this article analyzes the role of museum pedagogy in the development of cultural integration in the educational process on the basis of a comprehensive approach. It highlights the theoretical foundations of museum pedagogy, the stages of its formation and development and its interaction with the modern educational system. In particular, the cultural and educational functions of museums and their impact on the intellectual, aesthetic, and social development of students are scientifically substantiated. The article extensively analyzes the unique aspects of the educational process organized in a museum environment – exhibitionism, interactivity, and experiential learning opportunities. The process of integrating museum pedagogy with education in different periods is also consistently reviewed, revealing its importance today. The modern stage highlights the role of innovative pedagogical approaches, digital technologies, and interactive methods used in museums in improving the effectiveness of education. The results of the study show that museum pedagogy, in addition to promoting cultural heritage, is an important factor in developing students' independent thinking, activating their cognitive activity, and enriching the educational process in content.

Keywords

museum pedagogy, cultural integration, educational process, cultural heritage, interactive methods, innovative technologies, exposition, exhibitionism, educational effectiveness, personal development, pedagogical approach.

Today, the education system is evolving beyond the boundaries of traditional educational institutions and is becoming increasingly integrated with various social and cultural institutions of society. In this process, linking education to real life, expanding students' practical experience, and ensuring their active participation are among the main directions of modern pedagogy. In this context, museums are becoming increasingly important as an important component of the educational process, not only as a place for the preservation and display of cultural heritage,

but also as an effective pedagogical environment that enriches the learning process of students and directly introduces them to historical, cultural and social values. Museum pedagogy, on the other hand, is developing as a scientific and practical direction that ensures the integration of education and culture, and has a comprehensive impact on the intellectual, aesthetic, and social development of the individual. In this process, students have the opportunity to directly perceive theoretical knowledge through real exhibits, which serves for a solid and deep assimilation of knowledge, while developing their cognitive skills such as observation, analysis, comparison and inference and forming their cultural identity.

In practice, however, it is often observed that museums are interpreted only as a place where historical exhibits are stored and displayed, but according to modern pedagogical views, as an interactive educational environment, they are an important tool that ensures the active participation of students in the process of acquiring knowledge, therefore, fully revealing the educational capabilities of museums and their integration into the educational system. The choice of this topic is also associated precisely with the strengthening of the experience-based learning (experiential learning) approach in modern education, which is explained by the need to increase the activity of students, direct them to independent thinking and provide knowledge based on real-life situations. At the same time, today the upbringing of the younger generation in the spirit of national and universal values, the formation of historical memory, cultural consciousness and social responsibility in them remains one of the important tasks, in the process of which museums serve to develop the aesthetic taste of students, to educate them in the spirit of respect for cultural heritage, and to

Scientific sources widely cover the formation and development of museum pedagogy, interpreting it as a complex scientific direction formed at the intersection of museology, pedagogy, and psychology [1], [2]. Western European scientists, in particular G. Kershensteiner and A. Lixtvark interpreted museums as a pedagogical tool that develops students' independent thinking and engages them in active learning, presenting museum exhibitions not only as a source of knowledge, but also as a didactic tool that forms analytical thinking [3]. Freudental introduced the concept of "museum pedagogy" into scientific discourse and substantiated the need for a systematic study of museums as an important component of the educational system by developing its theoretical and methodological foundations [4].

In the Russian scientific school, museum pedagogy is considered a complex discipline related to pedagogy, psychology, and museology, in which the influence of the museum environment on the development of the individual, the socialization process, and the formation of cultural competencies is studied in depth [5], [6].

Modern research recognizes museums as interactive and innovative educational environments, and emphasizes that the widespread introduction of digital technologies, virtual tours, and multimedia tools has taken museum pedagogy to a new level [7]. Also, according to the constructivist approach, the student is not a passive recipient of knowledge, but an active subject who independently forms it based on his or her own experience, which is especially effective in a museum environment. In general, museum pedagogy, as an important direction for the integration of education and culture, enriches the learning process of students, develops their creative and critical thinking and serves to form cultural identity and historical memory, therefore, its wide introduction into the educational system is one of the urgent tasks of today.

This study was conducted using a comprehensive scientific approach, focusing on the role and effectiveness of museum pedagogy in promoting cultural integration in the educational process. The research methodology was aimed at revealing the theoretical foundations of museum pedagogy, analyzing its practical capabilities, and substantiating its integrative role in the modern education system by combining various scientific methods. In this process, an analytical approach was first used, systematically studying scientific literature, monographs, articles, and international studies on museum pedagogy. As a result, the views of different authors were compared, their general and different aspects were clarified, and existing theoretical concepts were summarized [8]. This further strengthened the scientific foundations of museum pedagogy and made it possible to more accurately determine its place in the educational system.

Also, the method of comparative analysis took a significant place in the research process. Through this method, directions of development of museum pedagogy, applied pedagogical approaches and innovative technologies were compared in European, us and Russian experiments. The results of the comparative analysis helped to identify commonalities and differences between museum education models in different regions, as well as to identify opportunities for adapting best practices to the national education system [9].

In addition, based on empirical observations, the educational activities of museums, excursions, interactive programs, and the participation of students in these processes were studied. In the process, the impact of the museum environment on students ' cognitive activity, their interest and the level of knowledge acquisition were analyzed [10]. The results clearly demonstrated the practical effectiveness of museum pedagogy and made it possible to compare theoretical views with the real pedagogical process. A systematic approach was also used in the study, considering museum pedagogy as a single complex system.

Its structural elements - goals, content, methods, means, and subjects - were analyzed in their interrelationships, revealing their integrative nature [11]. This approach served to deeply understand the internal structure of museum pedagogy, determine its functional capabilities, and scientifically justify its place in the educational process. The results of the study showed that museum pedagogy is an important tool in ensuring cultural integration in the educational process. It has a significant impact on the development of creative and critical thinking by activating the learning process of students [12].

The educational process organized in a museum environment helps students to acquire knowledge more deeply and consciously by combining theoretical knowledge with practical experience. The analysis also showed that the use of interactive methods significantly increases the effectiveness of education. Excursions, practical exercises, role-playing games, and problem-based approaches increase student engagement, encouraging them to independently seek, analyze, and synthesize knowledge. As a result, students develop independent thinking and problem-solving skills. At the same time, modern digital technologies are further increasing the effectiveness of museum pedagogy. Virtual tours, 3D modeling, interactive exhibitions, and online platforms allow students to remotely explore various museums, making the learning process more flexible and convenient [13], [14]. This expands the process of cultural integration and enriches the cultural and scientific worldview of students.

Overall, the study confirms that museum pedagogy is emerging as an innovative direction in the modern education system. It not only increases the effectiveness of education, but also develops the cultural awareness of students, helping to shape them as socially and culturally active individuals. In conclusion, museum pedagogy is one of the modern and promising pedagogical directions that serves to ensure cultural integration in the educational process. It enriches traditional forms of education and allows for a more lively, interactive and meaningful learning process through the museum environment. Museums, as educational spaces, play an important role in activating students' learning processes and in shaping and developing their historical thinking, cultural awareness, aesthetic taste, and social competencies. The results of the study show that museum pedagogy transforms students from passive knowledge recipients into active participants, developing their independent thinking, analysis, and creative approach skills. It was found that, in particular, the use of interactive teaching methods and modern digital technologies can increase the effectiveness of education, increase students' interest in knowledge, and deepen the process of cultural integration. Museum pedagogy also serves as an important tool that

ensures the seamless connection between education and culture and contributes to the comprehensive development of the individual. In this process, it is of particular importance to instill in students a sense of respect for national and universal values, historical memory, and social responsibility.

Based on the results of the study, the following proposals are put forward: expanding the educational capabilities of museums and their systematic integration with the general education system; wide introduction of interactive, innovative and experience-based teaching methods in museum pedagogy; development of the effective use of digital technologies, including virtual tours, multimedia tools and online educational platforms; study foreign advanced experiences and adapt them; to establish a system for improving the professional skills of teachers and museum specialists in museum pedagogy; and to further strengthen cooperation between educational institutions and museums.

In general, the development of museum pedagogy and its widespread application in the educational process is important for strengthening cultural integration, improving the quality of education, and developing the intellectual and cultural potential of the younger generation. Therefore, in-depth study and widespread implementation of this direction is considered one of the urgent scientific and pedagogical tasks of today.
